

PHILAGRO

Sunny® 50 SC | Optimise yield potential

OPTIMISE YIELD POTENTIAL THROUGH MANIPULATION OF VEGETATIVE GROWTH

Philagro is committed to providing you, the fruit producer, with new and proven products to help improve the yield of your fruit harvest.

Sunny® 50 SC is a suspension concentrate plant growth regulator for improved fruit set and/or reduced vegetative shoot growth in citrus (lemons and mandarins).

Sunny® 50 SC has a powerful formulation that enables you to effectively manage your lemons and mandarins to produce a quality harvest.

Application:

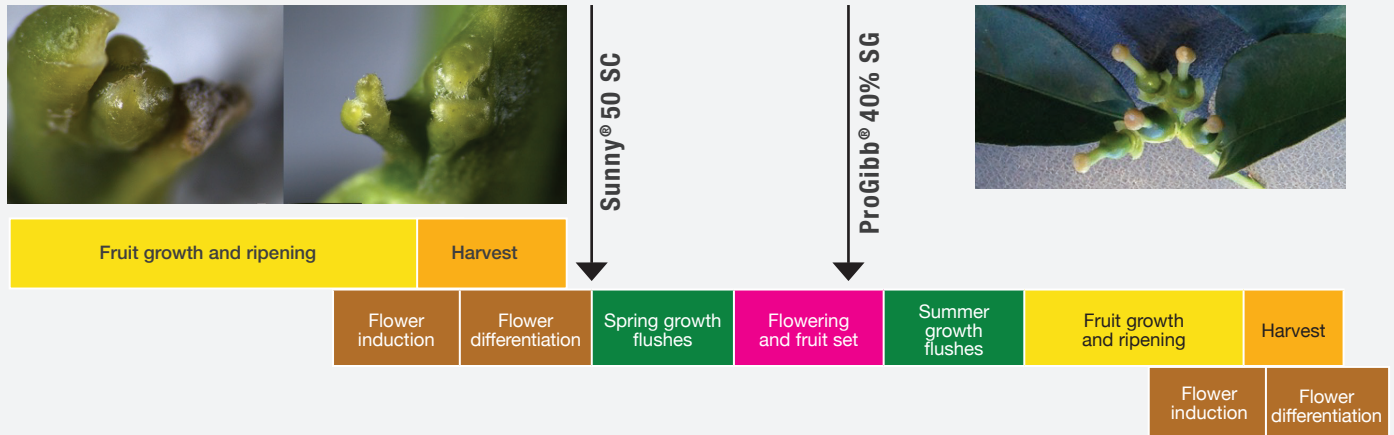

The active ingredient in **Sunny® 50 SC**, uniconazole-P, is absorbed through the roots of the plant and then translocate by way of sap flow and transpiration stream to the dormant buds. The active ingredient inhibits active GA biosynthesis (early in the GA biosynthesis process).

Guidelines for application:

- Timing plays a major role when it comes to application. If application occurs later than bud break, the effectiveness of **Sunny® 50 SC** in improving fruit set may decrease.
- One of the advantages of **Sunny® 50 SC** is the longer period of effectiveness due to the concentrated nature of the active isomer in the unique formulation. Therefore, only one application per season is sufficient.
- Always follow the recommendations on the product label (only 2 l per hectare per season).
- The **Sunny® 50 SC** application should be followed up with a **ProGibb® 40% SG** fruit set application as indicated on the **ProGibb® 40% SG** and **ProGibb® 4% SL** label.

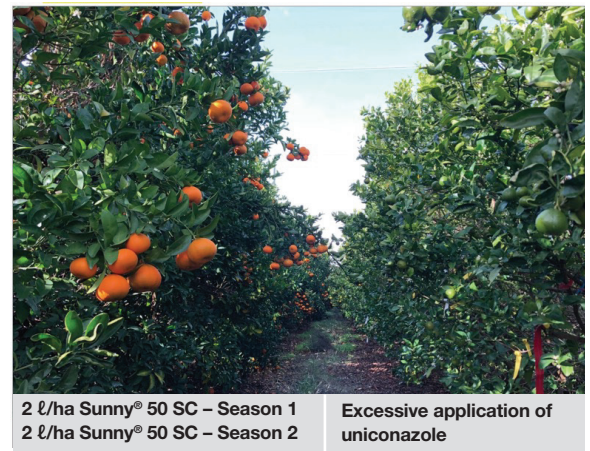

APPLICATION TO IMPROVE FRUIT SET

IMPACT OF SUNNY® 50 SC AND PROGIBB® 40% SG APPLICATION ON FRUIT SET

SOIL APPLICATION IN CITRUS

EFFECTIVE SHOOT GROWTH CONTROL BY SUNNY® 50 SC
